PrEP 101

PrEP Basics

PrEP stands for Pre-Exposure Prophylaxis

The word “prophylaxis” means to prevent or control the spread of an infection or disease.

PrEP is an HIV prevention option that works by taking one pill every day.

PrEP can help prevent you from getting HIV if you are exposed to the virus.

How Does It Work?

In several studies of PrEP, the risk of getting HIV infection was much lower — up to 92% lower — for those who took the medicines consistently than for those who didn’t take the pill.

How Can I Start PrEP?

Talk with your doctor or health care provider to determine if PrEP is right for you.

If you and your health care provider agree that PrEP might reduce your risk of getting HIV, he or she will test you for HIV and other sexually transmitted diseases.

Your health care provider will also test to see if your kidneys are working well.

If PrEP is a good option for you, your health care provider will give you a prescription.

How Do I Pay for PrEP?

PrEP is covered by most insurance programs.

You can also contact your local health department and HIV/AIDS service organizations for more information.

If you do not have insurance, your health care provider can direct you to medication assistance programs that may help pay for PrEP.
